

# ARCHIVE digital asset management

**Going digital?**

**Interested in reaping financial reward from your content store?**

**Need live broadcast capture for modern archiving?**

**Want to give fast access and preview to your archive on-line?**

TVP Archive has, through partnerships, knitted together a self contained solution. We can supply and support a DIY ingest and delivery system for the more robust tape formats. This is a cost effective means enabling an archive to encode content whilst attaching appropriate metadata using our data entry software.

Our partner, Cambridge Imaging Systems, is a leading UK digital media management developer. CIS has created advanced archive solutions for major corporate and public sector clients including the BBC, ITN, MoD and British Pathe, along with international news agencies such as The Newsmarket and respected academic institutions including the British Universities Film and Video Council.

Cambridge Imaging Systems has been developing software since 1991 to provide a flexible architecture, able to interface with existing systems and integrate with existing working practices.

TVP Archive can take you from difficult or ageing formats through the migration stages and into the digital world.

The company's comprehensive range of archive management tools can be used independently or integrated to provide the optimum solution for each application. These modules are branded under Imagen, a suite of media asset management applications for digitally ingesting, archiving and distributing very large quantities of stills or video; additionally BoB, an innovative off-air recording facility can be used to maintain a rolling archive and is ideal for compliance purposes.
