

ARCHIVE

storage

Are you storing audio or video tapes?

Are you digitising them?

Do you need an integrated storage solution with knowledge of film, data and tape?

TVP Archive provides a range of audiovisual archive storage and hosting services. Our facility is designed specifically for audiovisual archives, including a secure climate controlled environment with 24hr CCTV and coded door access. We work closely with an off-site storage company allowing us to offer large scale physical storage.

As a digital archive grows and as access demands on the archive increase, storage and bandwidth must meet these requirements. TVP Archive's scalable hosting services enable our customers to build their archive and its functionality to match market and logistic demands as they arise.

Our hosting services are designed to meet the specific technical and security standards required for robust, secure and high volume audiovisual applications.

Archives have traditionally stored large quantities of audio visual content on racks in a warehouse with enough accessibility to allow footage to be located and duplicated as and when required. Times are changing and accessibility needs are increasing as pressure mounts on archives to deliver self funding revenues.

TVP Archive adopted a dual approach to storage: The first using a traditional style library and the second file based. We can combine workflows to guarantee a seamless transition from the linear world to the digital whilst ensuring availability of content throughout.

Our managed hosting services are scalable, whether your service requires a few Gigabytes to deliver low resolution web video or Petabytes for high resolution broadcast storage, we can deliver a focused solution to meet your needs.
